

Patterns Rule!

Exploring Iterated Patterns

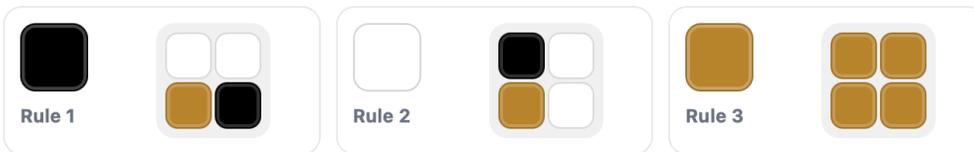

Patterns Rule! generates **substitution patterns**, which are built by repeatedly replacing each colored square in a pattern with a smaller grid of squares, according to a rule.

- Each **rule** tells you how a single square should be replaced.
- All squares are replaced **simultaneously** at each stage.
- Repeating this process creates increasingly detailed patterns.

How the process works

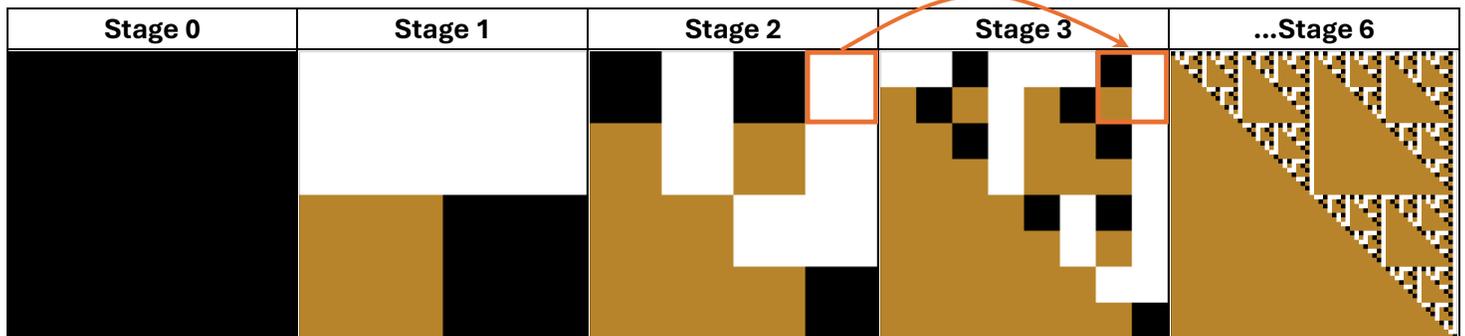

1. **Start at Stage 0**
The pattern begins as a single square using the first rule's color.
2. **Apply substitution rules**
Each square is replaced by a small grid (either 2×2 or 3×3) based on its rule.
3. **Advance stages**
At each new stage, every square is replaced again using the same rules.
4. **Track proportions**
As the pattern grows, the program tracks how much of the total area belongs to each color.

Here is an example using these three rules for black, white, and brown squares:

Rule 1 means that all black squares should be replaced, during the subsequent stage, by four squares (each half as wide and half as high as the original square, so that they take up the same area): two white squares on top and a brown and black one below. The third rule assures that all brown squares remain brown (they are not replaced by any other color).

Below are some stages for this replacement pattern. In the orange squares, you can see how the pattern for white squares (rule 2) appears at the next stage.

Main controls and features

of Rules

Pick from 2 to 6 rules.

Grid Size

Choose 2x2 or 3x3 grids.

Stage Slider

- Moves forward or backward through the stages of the substitution.
- Higher stages show more detail and more squares.
- The graph and percentages update automatically as the stage changes.

Pattern Rules Panel

Each rule has:

- A **large color square** at the left (the rule's color)
- A **grid of smaller squares** (the substitution rule)

Click any **small square** to change which rule color replaces that position.

Click any **color square (the large square)** to change a rule's color using a color picker.

Changing a color updates the pattern and the graph.

The default colors are chosen to remain distinguishable and accessible for users with different types of color blindness.

Rule Buttons

- **Solid rules**
Sets each rule to a uniform grid of its own color.
 - **Randomize**
Randomly assigns each small square to one of the available rule colors.
-

Graph and Summary

The graph shows how the **percentage of each rule color** changes across stages.

Below the graph:

- Each rule's **percentage** at the current stage is shown.
 - A **simplified fraction** shows the same value as a part of the total area (for example, 12.5% \rightarrow 1/8).
-

Save, Open, and Copy

- **Save** – lets you name a file and download it, so you can revisit, revise, or share it. Saved files are in a format (.json) that does not directly tie to the program, so they should be reloaded using...
 - **Open** – loads a previously saved pattern file.
 - **Copy Pattern** and **Copy Rules** – download to your Downloads folder an image of the main pattern or the rules in .png format.
-
